**TGS 2610 - for the detection of LP Gas**

**Features:**
- Low power consumption
- High sensitivity to LP and its component gases (e.g. propane and butane)
- Long life and low cost
- Uses simple electrical circuit

TGS2610 is a semiconductor type gas sensor which combines very high sensitivity to LP gas with low power consumption and long life. Due to miniaturization of its sensing chip, TGS2610 requires a heater current of only 56mA and the device is housed in a standard TO-5 package.

The TGS2610 is available in two different models which have different external housings but identical sensitivity to LP gas. Both models are able to satisfy the requirements of performance standards such as UL1484 and EN50194.

**Applications:**
- Residential LP leak detectors and alarms
- Portable LP detectors
- LP gas and vapor detection

**TGS2610-C00** possesses small size and quick gas response, making it suitable for gas leakage checkers.

**TGS2610-D00** uses filter material in its housing which eliminates the influence of interference gases such as alcohol, resulting in highly selective response to LP gas. This feature makes the sensor ideal for residential gas leakage detectors which require durability and resistance against interference gas.

The figure below represents typical sensitivity characteristics, all data having been gathered at standard test conditions (see reverse side of this sheet). The Y-axis is indicated as sensor resistance ratio (Rs/Ro) which is defined as follows:

\[ Rs = \text{Sensor resistance in displayed gases at various concentrations} \]
\[ Ro = \text{Sensor resistance in 1800ppm of iso-butane} \]

**IMPORTANT NOTE:** OPERATING CONDITIONS IN WHICH FIGARO SENSORS ARE USED WILL VARY WITH EACH CUSTOMER'S SPECIFIC APPLICATIONS. FIGARO STRONGLY RECOMMENDS CONSULTING OUR TECHNICAL STAFF BEFORE DEPLOYING FIGARO SENSORS IN YOUR APPLICATION AND, IN PARTICULAR, WHEN CUSTOMER'S TARGET GASES ARE NOT LISTED HEREIN. FIGARO CANNOT ASSUME ANY RESPONSIBILITY FOR ANY USE OF ITS SENSORS IN A PRODUCT OR APPLICATION FOR WHICH SENSOR HAS NOT BEEN SPECIFICALLY TESTED BY FIGARO.
Basic Measuring Circuit:
The sensor requires two voltage inputs: heater voltage \( V_H \) and circuit voltage \( V_C \). The heater voltage \( V_H \) is applied to the integrated heater in order to maintain the sensing element at a specific temperature which is optimal for sensing. Circuit voltage \( V_C \) is applied to allow measurement of voltage \( V_{RL} \) across a load resistor \( R_L \) which is connected in series with the sensor. A common power supply circuit can be used for both \( V_C \) and \( V_H \) to fulfill the sensor's electrical requirements. The value of the load resistor \( R_L \) should be chosen to optimize the alarm threshold value, keeping power dissipation \( P_S \) of the semiconductor below a limit of 15mW. Power dissipation \( P_S \) will be highest when the value of \( R_s \) is equal to \( R_L \) on exposure to gas.

The value of power dissipation \( P_S \) can be calculated by utilizing the following formula:

\[
P_S = \frac{(V_C - V_{RL})^2}{R_S}
\]

Sensor resistance \( R_s \) is calculated with a measured value of \( V_{RL} \) by using the following formula:

\[
R_s = \frac{V_C - V_{RL}}{V_{RL}} \times R_L
\]

For information on warranty, please refer to Standard Terms and Conditions of Sale of Figaro USA Inc. All sensor characteristics shown in this brochure represent typical characteristics. Actual characteristics vary from sensor to sensor. The only characteristics warranted are those in the Specification table above.
